

The image above shows how I interpreted the tables that we had to make for the homework with the following assumptions:

- Employees were only allowed one mailing address, however multiple employees could be associated to the same address resulting in a one to many relationship between Mailing and Employee (though if you wanted a many to many you would add a “joining” table between them)
- AddrID, EmployeeID, ManagerID, PositionID are keys for identifying each of mailing address, employee, position, and manager
- Employee and Manager have a many to many relationship
